                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY06295), a novel member of the PAS superfamily, where PAS stands of or PER/ARNT/SIM domains. The cDNA was identified in a search of murine ESTs designed to identify basic-helix-loop-helix-PAS (bHHH-PAS) proteins, and by RACE amplification of mouse lung cDNA. CC (MOP7 has been characterised as hypoxia inducible factor 3 alpha (See AAY06290), MOP3 (See CC (HIF 1 alpha (See AAY06289), HIF 2 alpha (See AAY06290), MOP3 (See CC (AAY06291), Ah receptor and Ah receptor nuclear translocator (ARNT), CC suggesting a different functional role. MOP7 probably regulates (the same genes as HIF 1 alpha and 2 alpha, as evidenced by its CC dimerisation with the same partners (ARNT, MOP3) and recognition (CC of the same core response element. MOP7 may have a functional CC role associated with response to low oxygen in the tissues in CC which it is expressed. The invention provides novel MOPS 2-9 nucleic acids (See AAX58891-88) and proteins (See AAX06289-97). CC These are useful in a variety of research, diagnostic and core applications. Several of the MOPs are alpha-class signal core and the mops are alpha-class signal core and the core are signal core.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DЬ
full-length chief in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a complementary to a polynucleotide comprises a 3'-end sequence, where the coligonucleotide comprises a 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13632 represent human cDNA sequences; AAB92446 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29-JUL-1999;

CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide which comprises at least 15 nucleotides and the combination of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by CC the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the AH13628 and CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB95893 represent human cDNA sequences; AAB92446 to CC conservation of the protein sequences; AAB9245 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               29-JUL-1999;

Claim 1; SEQ ID 3869; 2537pp + G English

CC sequence and an oligonucleotide comprising a sequence complementary to a conjuncted which comprises a 3' end sequence, where the coligonucleotide which comprises a 3' end sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of the 5' end sequence/3' end sequence is selected from those defined in comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and comprise therapy. The primer sets can be used in antisense therapy and comprise the specification. The primer sets can be used in antisense therapy and comparison of the specific sets of the primers are also useful for the comparison of the full-length cDNAs. The primers allow obtaining of the full-length cC the full-length cDNAs. The primers allow obtaining of the full-length cC cDNAs easily without any specialised methods. AAH013166 to AAH13628 and CC AAH3633 to AAH18742 represent human cDNA sequences; AAB92446 to AAH3633 represent human amino acid sequences; and AAH13629 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification of the present invention. The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-ord primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end eotides and γď ဇ္

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set ccomprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end cc complementary to a polynucleotide which comprises a 3'-end sequence complementary to a CC oligonucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises a 1 nucleotides and the combination of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primers sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         29-JUL-1999;

The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH1363 represent oligonucleotides, all of which are used in the exemplificatiof the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                     447
                                                                                                                                                                                                                                                                                                                                     330

the 502 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence which comprises a 5'-end cCC oligonucleotide comprises a 3'-end sequence, where the CCC oligonucleotide comprises a 1-end sequence, where the CCC oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in CCC the 5'-end sequence/3'-end sequence is selected from those defined in CCC the specification. The primers stress can be used in antisense therapy and CCC in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length CCC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CCC AAB95893 represent human canid sequences; and AAH13629 to AAH13632 represent numan amino acid sequences; and AAH13629 to AAH13632 represent human canid sequences; and AAH13629 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent human canid sequences; and AAH13629 to AAH13632 represent human canid sequences; and AAH13629 to AAH13632 represent human canid sequences; and AAH13632 represent human canid sequences; and AAH13639 to AAH13639 represent human canid sequen
                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs detection by the

Claim IJ 21; 2537pp + CD ROM; English.

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which complementary to the the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the coligonucleotide comprises a 3'-end sequence, where the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers set scan be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13631 to AAH13632 t AAH13629 eotides

CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises at least 15 nucleotides and the combination of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by CC the full-length cDNAs. The primers allow obtaining of the full-length CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB95893 represent human canno acid sequences; AAB92446 to CC cof the present oligonucleotides, all of which are used in the exemplification CC of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID 645; 2537pp + CD ROM;

to the complementary strand of a polynucleotide which comprises one of consideration constructed constructions and of a polynucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary strand of a polynucleotide which comprises a 5'-end complementary to the polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the complementary to a polynucleotide comprises a 3'-end sequence, where the polynucleotide comprises as 3'-end sequence, where the specification. The primer sets can be used in antisense therapy and constitution of the specification. The primer sets can be used in antisense therapy and constitution and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the constant of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CAAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to CAAH3633 to AAH18741 human amino acid sequences; AAB92446 to constant of the constan

                                                                                                                                                                                                                                      or the Ah receptor nuclear translocator (ARNT). To obtain extended open reading frames for each EST, an anchored-PCR strategy was used to amplify additional flanking sequences from a commercial HepG2 library MOP2 appears to be related structurally and functionally to MOP1 (see AAY06289). It interacts with ARNT, but not AHR, and drives transcription in its ARNT-dimerised form. Unlike MOP1, it does not appear to interact significantly with HSP90. MOP2 is induced by low oxygen and may be involved in hypoxia responses in difference cells and tissues. MOP2 is sometimes referred to as hypoxia inducible factor 2 alpha. The invention provides novel
                                                                                                                                                                                                                                                                                                                                                                                      This is the nucleotide sequence of a cDNA encoding MOP2 (see AAY06290), a novel member of the PAS superfamily, where PAS stands for PER/ARNT/SIM domains. The cDNA was identified in an iterative search of human ESTs designed to identify basic-helix-loop-helix-PAS (bHLH-PAS) proteins that interact with either the Ah receptor (AHR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human
                                                                                                                                                                            MOPS 2-9 nucleic acids (see AAX908289-97).

These are useful in a variety of research, diagnostic and therapeutic applications. Several of the MOPs are alpha-class hypoxia-inducible factors. Others are involved in circadian signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 6; Page 94-95; 106pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-AUG-1999

The mutant lacks the transactivating domain (see AAY)9158) of the wild-type protein (see also AAY)9161). The invention is based on the discovery that EPAS1 binds to cis-acting regulatory sequences associated with genes encoding angiogenic factors such as vascular endothelial cell growth factor (VEGF) and VEGF receptors such as KDR/flk-1 and flt-1, thereby transactivating the promoters of such genes. A claimed method of inhibiting angiogenesis in a mammal comprises administering to the mammal a compound which inhibits binding of EPAS1 to the cis-acting transactivation regulatory DNA of an angiogenic factor (see AAZ94051). The compound may be an EPAS1 polypeptide lacking a transactivation domain or a nucleic acid encoding such a polypeptide. When such an EPAS1 mutant is bound to a cis-acting regulatory DNA, it prevents wild-type EPAS1 binding and thereby inhibits transcription of a gene encoding an angiogenic factor such as VEGF, and hence angiogenesis. The mutant is preferably administered to an atherosclerotic lesion or to a tumour site.

Angiogenesis is also inhibited using a compound, such as an EPAS1 compound to the procedular compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       damage, iscl

                   protein 1 (EPASI). EPASI proteins can regulate specification of endothelial tissue, such as vasculature, the blood-brain barrier, etc. The protein can be used in a screening assay for agents that modulate binding of EPASI to a binding target, especially a basic helix-loop-helix (bHLH)/PAS protein, a heat shock protein or hypoxia inducible factor (HIF-I alpha) binding site. The EPASI protein is inducible factor (HIF-I alpha) binding site.
                                                                                                                                                                                                                                                                                                      Endothelial PAS domain protein 1 proteins regulators, e.g. a heat shock protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Endothelial PAS domain protein 1; EPAS1; screening assay; gene the endothelial tissue specification; EPAS1 binding; heat shock proteit basic helix-loop-helix motif; bHLH; hypoxia inducible factor; HIF-1 alpha binding site; binding affinity; genetic hybridisation

The proteins may be produced recombinantly from transformed host cells from the subject EPAS1 encoding nucleic acids or purified from mammalian cells. The proteins may be used in diagnosis (e.g. genetic hybridisation screens for EPAS1 transcripts), therapy (e.g. gene therapy to modulate EPAS1 gene expression) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating B-cell specific activators or other transcriptional regulators, reagents for screening chemical libraries for lead pharmacological agents, etc.).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

CKDR/filk-1 and filt-1, thereby transactivating the promoters of such as genes. A claimed method of inhibiting angiogenesis in a mammal comprises administering to the mammal a compound which inhibits binding of EPAS1 to the cis-acting transcription regulatory DNA of an angiogenet factor (see AAZ94051). The compound may be an EPAS1 polypeptide lacking a transactivation domain (see AAY79160) or a nucleic acid encoding such a polypeptide, an antisense nucleic acid complementary to mRNA encoding EPAS1, or an EPAS1-specific antibody. The compound is preferably administered to an atherosclerotic The compound is preferably administered to an atherosclerotic acid compound, such as an EPAS1 dominant negative mutant, which inhibits binding of EPAS1 to the EPAS-binding element, ARNT4 (see AAY79162). Angiogenesis can be promoted by administering EPAS1 DNA to increase expression of VEGF or VEGF receptor in endothelial cells of a

The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (C) marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (C) the immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's colitis; (c) cardiovascular disorders such as myocardial ischaemias; (C) disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (C) disease, and felling; (e) neurological diseases e.g. cerebral anoxia and cc epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genetic element involved in a cellular process. The method involves comparing gene expressions in two cells, where one cell has altered levels of a biological molecule, and identifying the genetic element whose expression differs, by comparing expression under different environmental conditions. The method is useful for identifying mutations and polymorphisms that affect the biological response to a particular cellular process. The method also allows the molecular dissection of biological pathways by altering a particular pathway under study. By introducing a heterologous nucleic acid into a cell population, the level of a particular molecule can be influenced, allowing a pathway to be dissected into its precise molecular components. The main use of the method is to compare gene expression in cells from a diseased patient and from a normal patient. This sequence represents a human endothelial pas domain protein 1 which is inserted into an Adapt ires-GFP plasmid for use in identification of hypoxia-regulated genes in macrophages.
